# M980xA Series PXIe Vector Network Analyzer

As the margins for multiport devices become tighter, your test equipment needs to be one step ahead. The Keysight M980xA PXIe Vector Network Analyzer (VNA) meets the most demanding multiport challenges with a true multiport architecture that offers exceptional performance no matter how many ports you use. Gain deeper insights into your devices with the widest available portfolio of measurement applications for PXI VNAs, including spectrum analysis, noise figure measurements, and more.

The M980xA Series offers the performance required for testing passive components, amplifiers, mixers or frequency converters. It provides best-in-class key PXI VNA specifications such as dynamic range, measurement speed, trace noise and temperature stability. Each module is a completely independent vector network analyzer with 2-, 4- or 6-ports up to 20 GHz, or 2-ports up to 53 GHz. The modules are easily configured as a true multiport VNA by using additional modules installed in the same chassis, and a VNA with up to 50-ports can be configured in a single chassis for multiport applications. All test ports are fully synchronous, so multiple ports can be measured simultaneously with multiport error correction applied.

The M980xA utilizes the same measurement science as other Keysight VNAs such as the PNA, ENA and USB VNA. A common software platform makes it easy to choose the right level of performance to match budget and measurement needs. This commonality guarantees measurement consistency, repeatability, and a common remote-programming interface across multiple instruments in R&D and manufacturing.

#### **Definitions**

#### Specification (spec)<sup>1</sup>

Warranted performance. Specifications include guardbands to account for the expected statistical performance distribution, measurement uncertainties, and changes in performance due to environmental conditions. All specifications and characteristics apply over a 25 °C ±5 °C range (unless otherwise stated).

The following conditions must be met:

- Module temperature is between 37 to 50 °C (2-port option), 40 to 53 °C (4-port option) and 43 to 56 °C (6-port option).
- Instrument has been turned on for 60 minutes with VNA application running.
- Instrument is within its calibration cycle.
- Instrument remains at a stable surrounding environment temperature (between -10 °C to 55 °C) for 60 minutes prior to turn-on.

#### Characteristics (char.)

A performance parameter that the product is expected to meet before it leaves the factory, but that is not verified in the field and is not covered by the product warranty. A characteristic includes the same guardbands as a specification.

#### Typical (typ.)

Expected performance of an average unit at a stable temperature between 25°C ±5°C for 60 minutes prior to turn-on and during operation; does not include guardbands. It is not covered by the product warranty. The instrument must be within its calibration cycle.

#### Nominal (nom.)

A general, descriptive term or design parameter. It is not tested, and not covered by the product warranty.

#### **Supplemental Information**

A performance parameter that is tested on sampled product during design validation. It does not include guardbands and is not covered by the product warranty.

#### Calibration

The process of measuring known standards to characterize an instrument's systematic (repeatable) errors.

#### **Corrected (residual)**

Indicates performance after error correction (calibration). It is determined by the quality of calibration standards and how well "known" they are, plus system repeatability, stability, and noise.

#### **Uncorrected (raw)**

Indicates instrument performance without error correction. The uncorrected performance affects the stability of a calibration.

1. For all tables in this data sheet, the specified performance at the exact frequency of a break is the better value of the two specifications at that frequency.

# **Dynamic Range**

The specifications in this section apply to measurements made with the Keysight M980xA vector network analyzer under the following conditions:

- No averaging applied to data

<sup>2.</sup> It may typically be degraded at 25 MHz.

# **Corrected System Performance**

This section provides specifications for the corrected performance of the M980xA PXIe VNA using either of the 85032F, 85052D, 85058B Mechanical Calibration Kit or the N4691D, N4694D Electronic Calibration (ECal) Module. To determine transmission and reflection uncertainty curves with other calibration kits, please download Uncertainty Calculator from <a href="http://www.keysight.com/find/na\_calculator">http://www.keysight.com/find/na\_calculator</a> to generate the curves for your specific calibration kit.

Measured with 10 Hz IF bandwidth, no averaging applied to data, environmental temperature =  $23 \,^{\circ}$ C ( $\pm 3 \,^{\circ}$ C) with <  $1 \,^{\circ}$ C deviation from calibration temperature.

Accuracy of the test port input power relative to the reference input power level. Measured with 10 Hz IF bandwidth.

#### Dynamic Accuracy<sup>1</sup> – specification

M9800A, M9801A, M9802A, M9803A, M9804A

- 1. Dynamic accuracy is verified with the following measurements:
  - Compression over frequency
  - IF linearity at three single frequencies (30.6MHz, 49.6MHz and 99.6MHz) using a reference level of -20 dBm for an input power range of 0 to -60 dBm. For values below -60 dBm, refer to VNA Receiver Dynamic Accuracy Specifications and Uncertainties.

With high attenuation. SA detector accuracy is residual error of IF response calibration. IF response is characterized with M980xA's standard measurement class after power and S-parameter calibration. Therefore the SA total absolute amplitude accuracy includes power meter, S-parameter and SA detector accuracies. Add input attenuation switching uncertainty if receiver attenuator is changed after user calibration.

### Multi-module Measurements with S95551A Software

When the S95551A software is installed, the M980xA PXIe VNA have the ability to be configured into a multiport network analyzer with multiple PXI modules. Adding a second module to the PXI chassis would provide additional test ports to the VNA. This configuration provides a full featured multiport vector network analyzer capability with full crossbar S-parameter measurement capability.

Multiport configurations using up to 17 modules (ex. 34-ports with 2-port modules) or maximum 66 test ports (11x 6-port modules) have been evaluated.

For multi-module operation, all single-module specifications apply except trace noise, test port noise floor and system dynamic range. The other performance of multi-module configurations will meet the single-module specifications in the data sheet.

The guidance provided here is given as general reference based on Keysight's internal evaluation of multiport PXIe VNA configurations. Not all multiport setups using multiple PXIe VNAs are tested as a multiport instrument in the factory. Interconnect cables included in the Y1730A must be used for connection among multiple M980xA modules. For more detail of multi-module configurations, refer to "M980xA Multi-module Installation Guide" at www.keysight.com/find/m980xa-mm.

#### Table 42. Multi-module Performance

- A check mark, √, indicates the performance parameter is the same as the corresponding single-module performance.
- An empty diamond, ◊, indicates that the performance parameter may be degraded as the number of modules increases

### Table 48. Environmental and Physical Specifications

Descriptions	Samples of this product have been type tested in accordance with the Keysight Environmental Test Manual and verified to be robust against the environmental stresses of Storage, Transportation and End-use; those stresses include, but are not limited to, temperature, humidity, shock, vibration, altitude, and power line conditions.  Test Methods are aligned with IEC 60068-2 and levels are similar to MIL-PRF-28800F Class 3.		
Temperature	Operating	0 to 50 °C ambient 10 to 70 °C module temperature	
	Non-operating	-40 to 70 °C	
Humidity	Operating	Type tested at 20 to 80 %, wet bulb temperature <29 °C (non-condensing)	
	Non-operating  Type tested at 20 to 90 %, wet bulb temperate   <40 °C (non-condensing)		
Altitude	Operating	Up to 2,000 meters (6,561 feet)	
Allitude	Non-operating	Up to 4,572 meters (15,000 feet)	
Vibration	Operating	0.3 G maximum, 5 Hz to 500 Hz	
VIDIALIOII	Non-operating	0.75 G maximum, 5 Hz to 500 Hz

Data transfer includes real and imaginary pairs and includes transferring S-parameters for 2-, 4-, 6- and 24-port calibrations. Uncorrected
measurements are for one sweep direction and transferring the corresponding S-parameters.

### Table 54. Software

Description	Information
Keysight IO library	The IO library suite offers a single entry point for connection to the most common instruments including AXIe, PXI, GPIB, USB, Ethernet/LAN, RS-232, and VXI test instrument from Keysight and other vendors. It automatically discovers interfaces, chassis, and instruments. The graphical user interface allows you to search for, verify, and update IVI instrument and soft front panel drivers for modular and traditional instruments. The IO suite safely installs in side-by-side mode with NI I/O software. Free software download at <a href="https://www.keysight.com/find/iosuite">www.keysight.com/find/iosuite</a>
Keysight soft front panel	The PXI module includes a soft front panel (SFP), a software based graphical user interface (GUI) which enables the instrument's capabilities from your PC.
Command Expert	Assists in finding the right instrument commands and setting correct parameters.  A simple interface includes documentation, examples, syntax checking, command execution, and debug tools to build sequences for integration in Excel, MATLAB, LabVIEW, VEE, and System VUE. Free software download at www.keysight.com/find/commandexpert
Example programs	Setting up a measurement Guided calibration Data acquisition Data transfer
Example programming languages	C, C++, C#, VB, LabVIEW
